## Transceiver Block Diagram

## Transmitter Section

### **Tx\_Disable**

Tx\_Disable is an input pin that is used to shut down the XGSPON transmitter optical output at the same time. It is pulled up within the module with a 4.7k $\Omega$  to 10k $\Omega$  resistor. Its states are: low (0 – 0.8V) - transmitter on; (>0.8, < 2.0V) - undefined; high (2.0 – VCC) - transmitter disabled; open - transmitter disabled. The Tx\_Disable signal is “high” (LVTTTL “logic 1”) to turn off the laser output. The laser will turn on when Tx\_Disable is “low” (LVTTTL “logic 0”).

### **XGSPON TD+/-**

XGSPON\_TD+/- are the differential XGSPON transmitter inputs. They are AC-coupled, differential lines with 100 $\Omega$  differential termination inside the module. It allows a differential input swing of 120-850mV, 9.953Gbps data rate.

## Receiver Section

### **XGSPON\_SD**

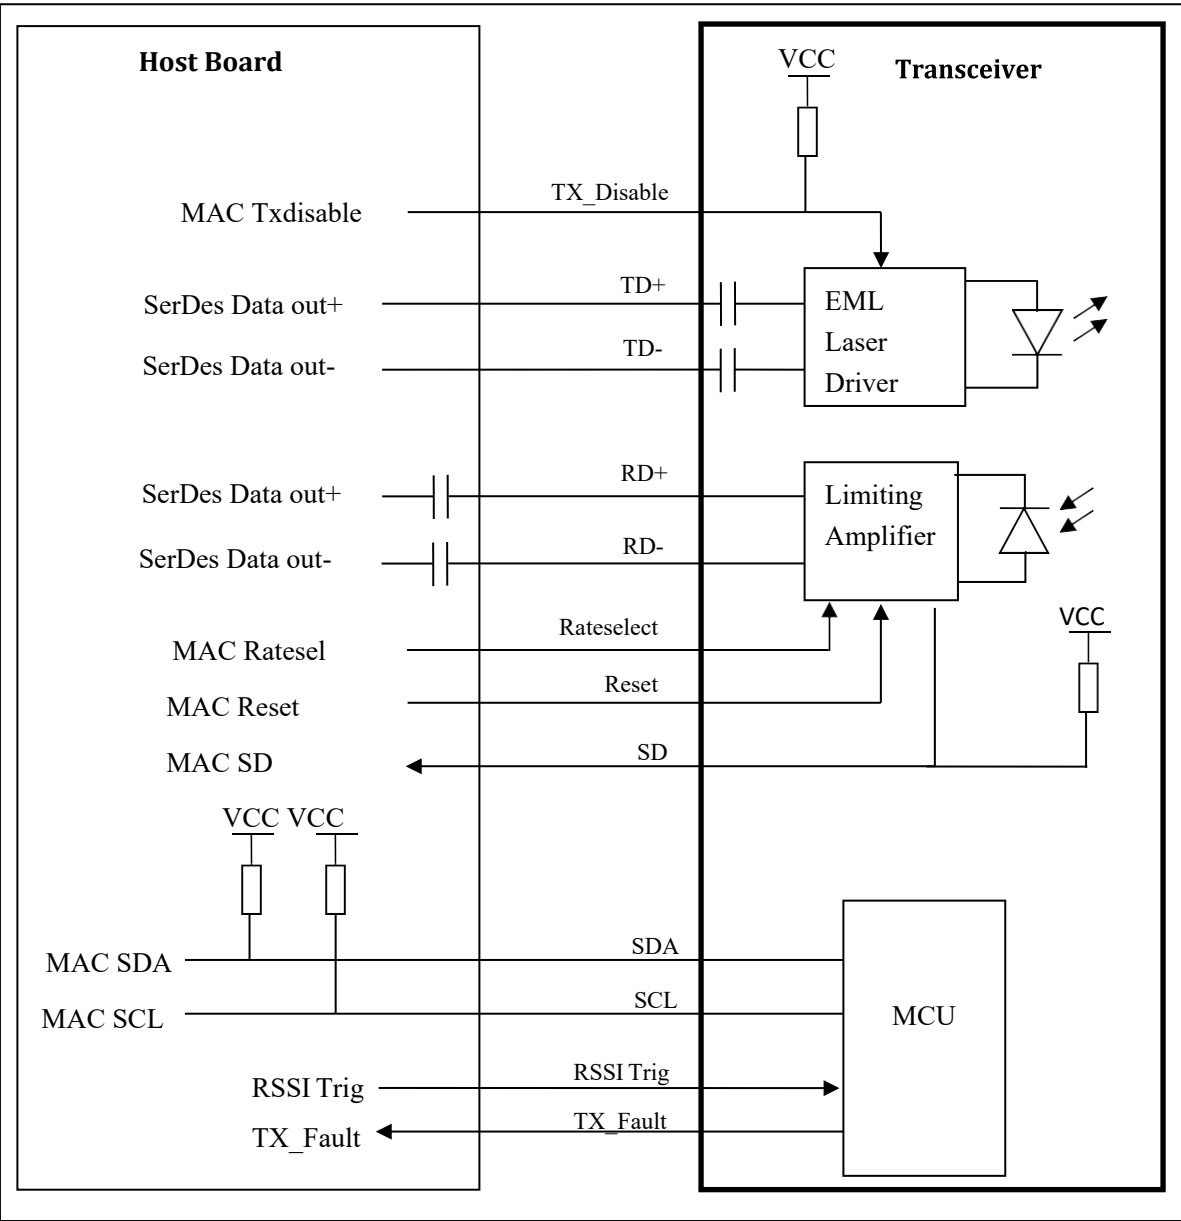

SD (Signal Detect) is an open collector/drain output, which should be pulled up with a 4.7k $\Omega$  to 10k $\Omega$  resistor to a voltage between 2.4V and Vcc+0.3V. When “low,” this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). “High” indicates normal operation. In the “low” state, the output will be pulled to < 0.4V.

### **XGSPON RD+/-**

These are the XGSPON differential receiver outputs. They are DC coupled 100 $\Omega$  differential lines which should be terminated with 100 $\Omega$  (differential) at the user SERDES. The AC coupling is done on the host board. The voltage swing on these lines will be between 400 and 800mV differential output when properly terminated.
